US-09-735-567-2/c  
Sequence 2, Application US/09735567  
Patent No. 6608190  
GENERAL INFORMATION:  
APPLICANT: Brumccj, Michael  
TITLE OF INVENTION: Nucleic Acid Fragments for the Identification of Bacteria in  
FILE REFERENCE: BC1033 US NA  
CURRENT APPLICATION NUMBER: US/09/735,567  
PRIOR FILING DATE: 2000-12-13  
PRIOR APPLICATION NUMBER: 60/171,140  
PRIOR FILING DATE: 16 DECEMBER 1999  
NUMBER OF SEQ ID NOS: 30  
SOFTWARE: Microsoft Office 97  
SEQ ID NO 2  
LENGTH: 1467  
TYPE: DNA  
ORGANISM: Unknown Organism

FEATURE:  
OTHER INFORMATION: Description of Unknown Organism: Brachymonas  
OTHER INFORMATION: Nucleotide sequence of 16S rDNA corresponding to strain NBE13  
US-09-735-567-2

```
US-09-748-205-1
; Sequence 1, Application US/09748205
```

```
; Patent No. 6586562
```

```
; GENERAL INFORMATION:
```

```
; APPLICANT: Canon Inc.
```

```
; TITLE OF INVENTION: Poly(hydroxyalkanoate)ib manufacturing method, and microorganism
```

```
; TITLE OF INVENTION: those are used for the method.
```

```
; FILE REFERENCE: 4351009
```

```

; CURRENT APPLICATION NUMBER: US/09/748,205
; CURRENT FILING DATE: 2000-12-27
; NUMBER OF SEQ ID NOS: 1
; SEQ ID NO 1
; LENGTH: 1501
; TYPE: DNA
; ORGANISM: Pseudomonas jessenii 161 strain.

RESULT 52
US-09-557-884-1/c
; Sequence 1, Application US/09557884
; Patent No. 6506581
GENERAL INFORMATION:
APPLICANT: Fieischmann et al.
TITLE OF INVENTION: The Nucleotide sequence of
the Haemophilus influenzae Rd Genome. Fragments
Thereof, and Uses Thereof
NUMBER OF SEQUENCES: 1
CORRESPONDENCE ADDRESS:
ADDRESS: Human Genome Sciences, Inc.
STREET: 9410 Key West Avenue
CITY: Rockville
STATE: MD
COUNTRY: USA
ZIP: 20850
COMPUTER READABLE FORM:
MEDIUM TYPE: 3 1/2 inch diskette
COMPUTER: Dell Pentium
OPERATING SYSTEM: MS DOS v6.22
SOFTWARE: ASCII Text
CURRENT APPLICATION DATA:
```

```
/ APPLICATION NUMBER: US/09/557,884

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

US-11-151-847-1
; Sequence 1, Application US/11151847
; Publication No. US20060002909A1
; GENERAL INFORMATION:
; APPLICANT: Kabushiki Kaisha Yonezawa Birtu Shituteemu Sabisu
; TITLE OF INVENTION: A microorganism separated from kefir grains, a microorganism cult
; TITLE OF INVENTION: obtained by culturing this microorganism or microorganisms inclu
; TITLE OF INVENTION: and a product using them.
; FILE REFERENCE: H16P1032
; CURRENT APPLICATION NUMBER: US/11/151,847
; CURRENT FILING DATE: 2005-06-13
; NUMBER OF SEQ ID NOS: 1
; SEQ ID NO 1
; LENGTH: 1521
; TYPE: DNA
; ORGANISM: Lactobacillus mali
US-11-151-847-1

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX  
XX This sequence represents a 16S rDNA sequence derived from an ammonia  
XX oxidizing bacteria (AOB). This sequence may be used in a composition  
XX which comprises an isolated bacterial strain that oxidizes ammonia to  
XX nitrite. The composition may be used for alleviating or preventing the  
XX accumulation of ammonia in a medium. The ammonia is reduced by at least  
XX 30% when compared with a level of ammonia that would exist in the absence  
XX of the bacterial strain. The composition is useful for alleviating or  
XX preventing the accumulation of ammonia in aqueous environment, e.g. a  
XX freshwater or seawater aquarium.

 PT New bacteria capable of oxidizing ammonia to nitrite, for preventing or  
 PT alleviating the accumulation of ammonia in fresh water aquaria, seawater  
 PT aquaria and waste water.  
 XX  
 PS Claim 2; Page 6; 62pp; English.  
 CC The invention relates to 4 novel types of ammonia-oxidising bacteria  
 CC (AOB) found in freshwater aquaria. The bacteria are able to oxidise  
 CC ammonia to nitrite and are members of the ammonia-oxidising bacteria  
 CC family of the beta subdivision of Proteobacteria. The 4 types of bacteria  
 CC can be distinguished on the basis of their 16S rRNA (ribosomal RNA) gene  
 CC sequences (ABA02416-ABA02419), and are classified as AOB type A (e.g.,  
 CC R7clone140), type A1 (e.g., R7clone187), type B (e.g., R3clone5) and type  
 CC C (e.g., R3clone47). The invention also encompasses isolated 16S rRNA  
 CC gene sequences of the ammonia-oxidising bacteria of the invention,  
 CC oligonucleotide probes and primers for the detection of these bacteria,  
 CC and compositions comprising the bacteria. The bacteria of the invention  
 CC are useful in biological filters for reducing ammonia accumulation in  
 CC both freshwater and seawater aquaria. They may also be used in waste  
 CC water treatment and in bioremediation processes to reduce the level of  
 CC pollution caused by ammonia. The present sequence represents R7clone187,  
 CC a 16S rRNA gene sequence from the type A1 ammonia-oxidising bacterium of  
 CC the invention. (Updated on 29-AUG-2003 to standardise OS field)

XX WPI; 2004-304936/28.  
XX New composition comprising an isolated bacterial strain that oxidizes  
XX ammonia to nitrite, useful for alleviating or preventing the accumulation  
XX of ammonia in aqueous environment.  
XX Claim 1; Page 15; 98pp; English.  
XX This sequence represents a 16S rDNA sequence derived from an ammonia  
XX oxidizing bacteria (AOB). This sequence may be used in a composition  
XX which comprises an isolated bacterial strain that oxidizes ammonia to  
XX nitrite. The composition may be used for alleviating or preventing the  
XX accumulation of ammonia in a medium. The ammonia is reduced by at least

CC 30% when compared with a level of ammonia that would exist in the absence  
CC of the bacterial strain. The composition is useful for alleviating or  
CC preventing the accumulation of ammonia in aqueous environment, e.g. a  
CC freshwater or seawater aquarium.

PT New bacteria capable of oxidizing ammonia to nitrite, for preventing or  
PT alleviating the accumulation of ammonia in fresh water aquaria, seawater  
PT aquaria and waste water.  
XX  
PS Claim 2; Page 7; 62pp; English.  
XX  
CC The invention relates to 4 novel types of ammonia-oxidizing bacteria  
CC (AOB) found in freshwater aquaria. The bacteria are able to oxidise  
CC ammonia to nitrite and are members of the ammonia-oxidizing bacteria  
CC family of the beta subdivision of Proteobacteria. The 4 types of bacteria  
CC can be distinguished on the basis of their 16S rRNA (ribosomal RNA) gene  
CC sequences (ABA02416-ABA02419), and are classified as AOB type A (e.g.,  
CC R3clones140), type A1 (e.g., R3clones187), type B (e.g., R3clones5) and type  
CC C (e.g., R3clones47). The invention also encompasses isolated 16S rRNA  
CC gene sequences of the ammonia-oxidizing bacteria of the invention,  
CC oligonucleotide probes and primers for the detection of these bacteria,  
CC and compositions comprising the bacteria. The bacteria of the invention  
CC are useful in biological filters for reducing ammonia accumulation in  
CC both freshwater and seawater aquaria. They may also be used in waste  
CC water treatment and in bioremediation processes to reduce the level of  
CC pollution caused by ammonia. The present sequence represents R3clones5, a  
CC 16S rRNA gene sequence from the type B ammonia-oxidizing bacterium of the  
CC invention. (Updated on 29-AUG-2003 to standardise OS field)

CC This sequence represents a 16S rDNA sequence derived from an ammonia  
CC oxidizing bacteria (AOB). This sequence may be used in a composition  
CC which comprises an isolated bacterial strain that oxidizes ammonia to  
CC nitrite. The composition may be used for alleviating or preventing the  
CC accumulation of ammonia in a medium. The ammonia is reduced by at least  
CC 30% when compared with a level of ammonia that would exist in the absence  
CC of the bacterial strain. The composition is useful for alleviating or  
CC preventing the accumulation of ammonia in aqueous environment, e.g. a  
CC freshwater or seawater aquarium.

 PT New bacteria capable of oxidizing ammonia to nitrite, for preventing or  
 PT alleviating the accumulation of ammonia in fresh water aquaria, seawater  
 PT aquaria and waste water.  
 PS Claim 2; Page 8; 62pp; English.  
 XX  
 CC The invention relates to 4 novel types of ammonia-oxidising bacteria  
 CC (AOB) found in freshwater aquaria. The bacteria are able to oxidise  
 CC ammonia to nitrite and are members of the ammonia-oxidising bacteria  
 CC family of the beta subdivision of Proteobacteria. The 4 types of bacteria  
 CC can be distinguished on the basis of their 16S rRNA (ribosomal RNA) gene  
 CC sequences (ABA02416-ABA02419), and are classified as AOB type A (e.g.,  
 CC R3clone140), type A1 (e.g., R3clone187), type B (e.g., R3clone5) and type  
 CC C (e.g., R3clone47). The invention also encompasses isolated 16S rRNA  
 CC gene sequences of the ammonia-oxidising bacteria of the invention,  
 CC oligonucleotide probes and primers for the detection of these bacteria,  
 CC and compositions comprising the bacteria. The bacteria of the invention  
 CC are useful in biological filters for reducing ammonia accumulation in  
 CC both freshwater and seawater aquaria. They may also be used in waste  
 CC water treatment and in bioremediation processes to reduce the level of  
 CC pollution caused by ammonia. The present sequence represents R3clone47, a  
 CC 16S rRNA gene sequence from the type C ammonia-oxidising bacterium of the  
 CC invention. (Updated on 29-AUG-2003 to standardise OS field)

XX  
XX The sequences given in AAC86021-30 represent 16S rDNA sequences from  
CC polyphosphate accumulating organisms (PAOs). Sequences which are unique  
CC to these 16S rDNA sequences are used to create a probe or primer for  
CC detecting the relevant organisms. The primer/probe sequences are useful  
CC for detecting PAO cells in a sample. By treating cells in the sample to  
CC fix cellular contents, contacting fixed cells with the primer/probe which  
CC is labelled with a radiolabel, a reporter group or a hapten, under

conditions which allow the probe to hybridize with 16S rRNA within the fixed cell, removing unhybridized probe from the fixed cells, and detecting the labeled probe-RNA hybrid by fluorescence in situ hybridization. The primer/probe sequences are useful for identifying PAOs that are capable of biologically removing phosphorus from waste water. Rapid assessment of the presence of a number of PAOs in a waste water sample, can be done using the primer/ probe sequences. They allow quick and convenient assessment of whether a sludge or waste water sample includes PAOs and allows quantitation of PAO cells in samples. (Updated on 11-SEP-2003 to standardise OS field)

PT Microorganism belonging to Denitromonas for removal of nitrogen oxide by  
 PT reduction of nitrogen oxide to nitrogen in gas or aqueous solution, has  
 PT specific mycological characters.

XX Disclosure; Page 6-7, 8pp; Japanese.

CC The present sequence represents a fragment of 16S rDNA gene of  
 CC Denitromonas aromatics. This is a novel microorganism belonging to the  
 CC new genus Denitromonas, and which has specific mycological characters.  
 CC The new microorganism efficiently reduces and removes nitrogen oxide. The  
 CC bacterium is used for the removal of nitrogen oxide. It reduces nitrogen  
 CC oxide to nitrogen in a gas or aqueous solution

PT Novel oligonucleotide probe or primer useful for detecting polyphosphate  
 PT accumulating organism in a sample, comprises a sequence that is unique to  
 PT 16S rDNA of polyphosphate accumulating organisms.

XX  
 PS Claim 4; Fig 3; 54pp; English.

XX The sequences given in AAC86021-30 represent 16S rDNA sequences from  
 CC polyphosphate accumulating organisms (PAOs). Sequences which are unique  
 CC to these 16S rDNA sequences are used to create a probe or primer for  
 CC detecting the relevant organisms. The primer/probe sequences are useful  
 CC for detecting PAO cells in a sample, by treating cells in the sample to  
 CC fix cellular contents, contacting fixed cells with the primer/probe which  
 CC is labelled with a radiolabel, a reporter group or a hapten, under  
 CC conditions which allow the probe to hybridize with 16S rRNA within the  
 CC fixed cell, removing unhybridized probe from the fixed cells, and  
 CC detecting the labeled probe-RNA hybrid by fluorescence in situ  
 CC hybridization. The primer/probe sequences are useful for identifying PAOs  
 CC that are capable of biologically removing phosphorus from waste water.  
 CC Rapid assessment of the presence of a number of PAOs in a waste water  
 CC sample, can be done using the primer/ probe sequences. They allow quick  
 CC and convenient assessment of whether a sludge or waste water sample  
 CC includes PAOs and allows quantitation of PAO cells in samples. (Updated  
 CC on 06-AUG-2003 to correct OS field.)

PT Novel oligonucleotide probe or primer useful for detecting polyphosphate  
PT accumulating organism in a sample, comprises a sequence that is unique to  
PT 16S rdna of polyphosphate accumulating organisms.  
XX  
PS  
PS Claim 4; Fig 3; 54pp; English.  
XX  
XX The sequences given in AAC86021-30 represent 16S rdna sequences from  
CC polyphosphate accumulating organisms (PAOs). Sequences which are unique  
CC to these 16S rdna sequences are used to create a probe or primer for  
CC detecting the relevant organisms. The primer/probe sequences are useful  
CC for detecting PAO cells in a sample, by treating cells in the sample to  
CC fix cellular contents, contacting fixed cells with the primer/probe which  
CC is labelled with a radiolabel, a reporter group or a hapten, under  
CC conditions which allow the probe to hybridize with 16S RNA within the  
CC fixed cell, removing unhybridized probe from the fixed cells, and  
CC detecting the labeled probe-RNA hybrid by fluorescence in situ  
CC hybridization. The primer/probe sequences are useful for identifying PAOs  
CC that are capable of biologically removing phosphorus from waste water.  
CC Rapid assessment of the presence of a number of PAOs in a waste water  
CC sample, can be done using the primer/ probe sequences. They allow quick  
CC and convenient assessment of whether a sludge or waste water sample

CC includes PAOs and allows quantitation of PAO cells in samples

PT	Depleting or isolating targeted nucleic acids e.g. rRNA, involves using a		
PT	bridging oligonucleotide comprising bridging region and a targeting		
PT	region complementary to a targeted nucleic acid; and a capture		
PT	oligonucleotide.		
PS	Claim 4; Page 171-172; 208pp; English.		
XX			
CC	This invention relates to a novel method for isolating, depleting or		
CC	separating a targeted nucleic acid, such as RNA, from a sample		
CC	comprising targeted and non-targeted nucleic acids. It effects a way of		
CC	enriching for non-targeted nucleic acids such as mRNAs. Isolating		
CC	sufficient quantities of high quality bacterial mRNA is a demanding		
CC	process which impedes analysis of bacterial gene expression in the		
CC	presence of host cells. A small percentage of bacterial mRNAs may be poly		
CC	-A tailed, but these are targeted for degradation and tend to be		
CC	unstable. As a result, the commonly employed method for mRNA purification		
CC	with eukaryotic cells, oligo-dT capture, is ineffective. The present		
CC	invention provides an alternative, more suitable method for mRNA		
CC	purification from prokaryotes. The method of the invention comprises the		
CC	incubation of a sample with a bridging oligonucleotide (containing a		
CC	targeting region) and subsequently incubating with a capture		
CC	oligonucleotide allowing the isolation of the target from the sample. The		
CC	method is useful for depleting or isolating targeted nucleic acid <sup>1</sup> for		
CC	example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S		
CC	or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may		
CC	comprise any one of 64 fully defined sequences as given in the		
CC	specification. The present sequence is that of a DNA sequence which		
CC	represents the sequence of 16S rRNA of Bordetella bronchiseptica related		
CC	to the invention.

PT      Pseudomonas cepacia KK01 strain 16S rRNA gene - also related probes and
PT      primers, useful for specific detection of P. cepacia strain KK01.
XX
PS      Claim 1; Page 21; 21pp; Japanese.
XX
CC      This sequence represents the 16S rRNA gene of Pseudomonas cepacia strain
CC      KK01. Fragments of the nucleic acid sequence (see AA01872-T02316) are
CC      useful as primers and probes for the specific detection of P. cepacia
CC      strain KK01. (Updated on 16-OCT-2003 to standardise OS field)

PT polymorphisms and mutations.
XX
PS Example 4; SEQ ID NO 32; 198pp; English.
XX
CC The specification describes the use of fragmentation-based methods and
CC systems including mass spectrometric methods for the analysis of sequence
CC variations including nucleic acid polymorphisms and mutations. The
CC fragmentation-based methods and systems of the invention are useful for
CC the analysis of sequence variations including nucleic acid polymorphisms
CC and mutations. The methods are useful for identifying a genetic disease
CC or chromosome abnormality; identifying a predisposition to a disease or
CC condition including obesity, atherosclerosis, or cancer; identifying an
CC infection by an infectious agent; providing information relating to
CC identity, heredity, or histocompatibility; identifying pathogens; or
CC determining haplotypes. AD016353-AD016361 represent Bordetella variable
CC 16S rRNA gene regions. Amplicons from this region were used to demonstrate
CC the invention. They were used to demonstrate a method for bacterial
CC typing by base-specific fragmentation.

DR      Novel oligonucleotide probe or primer useful for detecting polyphosphate
PT      accumulating organism in a sample, comprises a sequence that is unique to
PT      16S rDNA of polyphosphate accumulating organisms.
XX
PS      Claim 4; Fig 3; 54pp; English.
XX
CC      The sequences given in AAC86021-30 represent 16S rDNA sequences from
CC      polyphosphate accumulating organisms (PAOs). Sequences which are unique
CC      to these 16S rDNA sequences are used to create a probe or primer for
```

detecting the relevant organisms. The primer/probe sequences are useful for detecting PAO cells in a sample, by creating cells in the sample to fix cellular contents, contacting fixed cells with the primer/probe which is labelled with a radiolabel, a reporter group or a hapten, under conditions which allow the probe to hybridize with 16S rRNA within the fixed cell, removing unhybridized probe from the fixed cells, and detecting the labeled probe-RNA hybrid by fluorescence in situ hybridization. The primer/probe sequences are useful for identifying PAOs that are capable of biologically removing phosphorus from waste water. Rapid assessment of the presence of a number of PAOs in a waste water sample, can be done using the primer/ probe sequences. They allow quick and convenient assessment of whether a sludge or waste water sample includes PAOs and allows quantitation of PAO cells in samples. (Updated on 06-AUG-2003 to correct OS field.)

 DR Use of oligo:nucleotide(s) corresponding to bacterial 16S rRNA - for  
 PT inhibiting bacterial protein expression and treating bacterial infection.  
 XX Claim 26; Page 62-63; 73pp; English.  
 XX This polynucleotide comprises the 16S ribosomal RNA (rRNA) gene of  
 CC Burkholderia cepacia. The invention relates to methods and compositions  
 CC for the treatment of gram-negative bacterial infections employing novel  
 CC oligonucleotides as anti-microbial agents. The oligonucleotides are  
 CC targeted to the Shine-Dalgarno (SD) region of prokaryotes to inhibit  
 CC bacterial expression and hence inhibit bacterial infection. They  
 CC preferably comprise 10-35 consecutive bases of the 3' end of a bacterial  
 CC 16S rRNA (see also AAV24291-94). An oligonucleotide may also include a  
 CC transport moiety and may have DNA phosphate modifications to increase  
 CC nuclease resistance, or may be formulated in a liposome. A claimed method  
 CC for treating a bacterial infection of a patient comprises administering a  
 CC liposomal formulation of such an oligonucleotide. The oligonucleotides  
 CC can be used particularly for treating bacterial infections in pulmonary  
 CC diseases such as cystic fibrosis or tuberculosis. Since the SD sequence  
 CC is not present in eukaryotic cells, the oligonucleotides provide a  
 CC pathogen-specific therapeutic method

XX PT	Stereoselective synthesis of beta-amino acid such as D-beta- or L-beta-			
PT	phenylalanine, by contacting amino donor and amino acceptor in presence			
XX PT	of beta-amino acid transaminase to form beta-amino acid enantiomer, from			
XX PT	amino acceptor.			
PS	Claim 74; SEQ ID NO 1; 44pp; English.			
XX CC	The invention relates to methods for the stereoselective synthesis and			
CC	for the enantioselective enrichment of a beta-amino acid or its salt. The			
CC	methods involve contacting an amino donor and an amino acceptor in the			
CC	presence of a stereoselective beta-amino acid transaminase to form a beta			
CC	-amino acid enantiomer (or its salt) from the amino acceptor. The			
CC	invention also relates to purified stereoselective D-beta-transaminases			
CC	derived from a microorganism of the genera Variovorax, Nocardi,			
CC	Comamonas, Rhodococcus or Pseudomonas; purified stereoselective L-beta-			
CC	transaminases derived from a microorganism of the genus Alcaligenes;			
CC	methods of selecting and culturing microorganisms which express a beta-			
CC	transaminase; purified cultures of Variovorax paradoxus or Rhodococcus			
CC	opacus; the 16S ribosomal RNA gene (rDNA) of Variovorax paradoxus or			
CC	Rhodococcus opacus (ADW12666 and ADW12667, respectively); and a method of			
CC	detecting these 16S rDNA sequences. The methods of the invention are			
CC	useful for stereoselectively synthesizing a beta-amino acid such as D-			
CC	beta-phenylalanine or L-beta-phenylalanine, or for enriching one or the			
CC	other enantiomer in a racemic mixture. In the examples of the invention,			
CC	microorganisms from soil samples from two different environments were			
CC	screened transaminase activity on DL-beta-phenylalanine. Ribosomal DNA			
CC	sequencing was used to facilitate the taxonomic identification of two			
CC	purified microorganisms from the environmental samples. The present			
CC	sequence represents the specifically claimed 16S rDNA sequence which was			

CC	Identified as originating from	Varilovorex paradoxus.

XX  
PT bridging or isolating targeted nucleic acids e.g. rRNA, involves using a  
PT region complementary to a targeted nucleic acid, and a capture  
PT oligonucleotide.

XX  
PS Claim 4; Page 172; 208pp; English.  
CC This invention relates to a novel method for isolating, depleting or  
XX separating a targeted nucleic acid, such as rRNA, from a sample  
CC comprising targeted and non-targeted nucleic acids. It effects a way of  
CC enriching for non-targeted nucleic acids such as mRNAs. Isolating  
CC sufficient quantities of high quality bacterial mRNA is a demanding  
CC process which impedes analysis of bacterial gene expression in the  
CC presence of host cells. A small percentage of bacterial mRNAs may be poly  
CC -A tailed, but these are targeted for degradation and tend to be  
CC unstable. As a result, the commonly employed method for mRNA purification  
CC with eukaryotic cells, oligo-dT capture, is ineffective. The present  
CC invention provides an alternative, more suitable method for mRNA  
CC purification from prokaryotes. The method of the invention comprises the  
CC incubation of a sample with a bridging oligonucleotide (containing a  
CC targeting region) and subsequently incubating with a capture  
CC oligonucleotide allowing the isolation of the target from the sample. The  
CC method is useful for depleting or isolating targeted nucleic acid, for  
CC example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S  
CC or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may  
CC comprise any one of 64 fully defined sequences as given in the  
CC specification. The present sequence is that of a DNA sequence which  
CC represents the sequence of 16S rRNA of Bordetella parapertussis related  
CC to the invention.

PS
XX
XX The sequences given in AAC86021-30 represent 16S rDNA sequences from
XX polyphosphate accumulating organisms (PAOs). Sequences which are unique
XX to these 16S rDNA sequences are used to create a probe or primer for
XX detecting the relevant organisms. The primer/probe sequences are useful
XX for detecting PAO cells in a sample, by treating cells in the sample to
XX fix cellular contents, contacting fixed cells with the primer/probe which
XX is labelled with a radiolabel, a reporter group or a hapten, under
XX conditions which allow the probe to hybridize with 16S rRNA within the
XX fixed cell, removing unhybridized probe from the fixed cells, and
XX detecting the labeled probe-RNA hybrid by fluorescence in situ
XX hybridization. The primer/probe sequences are useful for identifying PAOs
XX that are capable of biologically removing phosphorus from waste water.
XX Rapid assessment of the presence of a number of PAOs in a waste water
XX sample, can be done using the primer/probe sequences. They allow quick
XX and convenient assessment of whether a sludge or waste water sample
XX includes PAOs and allows quantitation of PAO cells in samples

PT treating osteoarthritis.

PS Example 1; Page 52-54; 89pp; English.

CC The present invention relates to the use of an antibacterial agent in the  
 CC production of a treatment for osteoarthritis. The bacteria causing  
 CC osteoarthritis is Jantihnobacterium lividum. The present sequence is a  
 CC fragment of the 16s RNA coding sequence from J. lividum shown in the  
 CC exemplification of the invention

XX PT New nucleic acid encoding a 16S-23S spacer DNA sequences for bacterial  
XX PT species Acidovorax avenae subspecies citrulli, Xanthomonas cucurbitae and  
XX PT Erwinia tracheiphila, useful in identifying A. avenae subspecies citrulli  
XX PT in melons.  
XX PS Example 8; SEQ ID NO 1; 50bp; English.  
XX CC The present invention describes a nucleic acid molecule encoding a 16S-  
XX CC 23S spacer DNA sequence for the bacterial species Acidovorax avenae  
XX CC subspecies citrulli or avenae, Xanthomonas cucurbitae and Erwinia  
XX CC tracheiphila. Also described: (1) a pair of oligonucleotide primers,  
XX CC where at least one primer comprises 15-18, 15-22 or 20-25 bp; (2)  
XX CC detecting bacterial pathogen; (3) a diagnostic kit used in detecting the  
XX CC bacterial pathogen; (4) a polypeptide comprising the amino acid sequence  
XX CC (S1, see ADE11075); (5) an antibody that reacts with a polypeptide having  
XX CC the N-terminal amino acid sequence of the polypeptide; and (6) an  
XX CC immunoassay for detecting Acidovorax avenae subspecies citrulli that uses  
XX CC the antibody. The nucleic acid is useful in diagnostic assays for  
XX CC identifying Acidovorax avenae subspecies citrulli in melons. The present  
XX CC sequence represents an Acidovorax avenae subspecies citrulli 16S  
XX CC ribosomal RNA gene, which is used in the exemplification of the present  
XX CC invention.

 CC The invention relates to a novel algae-lysing bacteria Acidovorax  
 CC temperans KfCC 11294 and a method for removing algae using the same  
 CC microorganism, thereby effectively solving environmental problems caused  
 CC by algae. An algae-lysing bacteria Acidovorax temperans KfCC 11294  
 CC containing 16S rDNA having the nucleotide sequence of AD067894 is  
 CC provided, wherein Acidovorax temperans KfCC 11294 is isolated from  
 CC Seokhon lake. A method for removing algae comprises culturing Acidovorax

temperans KFOC 11294 and applying the cultured medium to algae living in water, where the cultured medium of *Acidovorax* temperans KFOC 11294 is obtained by culturing *Acidovorax* temperans KFOC 11294 in BG-11 medium and centrifuging the cultured medium. The algae is blue-green algae, and the blue-green algae is *Anabaena cylindrica*. The present sequence represents the *Acidovorax* temperans partial 16S rRNA gene.

XX Depleting or isolating targeted nucleic acids e.g. RNA, involves using a  
PT bridging oligonucleotide comprising bridging region and a targeting  
PT region complementary to a targeted nucleic acid, and a capture  
PT oligonucleotide.

Claim 4, Page 174, 208pp, English.

XX This invention relates to a novel method for isolating, depleting or  
XX separating a targeted nucleic acid, such as RNA, from a sample  
XX comprising targeted and non-targeted nucleic acids. It effects a way of  
XX enriching for non-targeted nucleic acids such as mRNAs. Isolating  
XX sufficient quantities of high quality bacterial mRNA is a demanding  
XX process which impedes analysis of bacterial gene expression in the  
XX presence of host cells. A small percentage of bacterial mRNAs may be poly  
XX -A tailed, but these are targeted for degradation and tend to be  
XX unstable. As a result, the commonly employed method for mRNA purification  
XX with eukaryotic cells, oligo-dT capture, is ineffective. The present  
XX invention provides an alternative, more suitable method for mRNA  
XX purification from prokaryotes. The method of the invention comprises the  
XX incubation of a sample with a bridging oligonucleotide (containing a  
XX targeting region) and subsequently incubating with a capture  
XX oligonucleotide allowing the isolation of the target from the sample. The  
XX method is useful for depleting or isolating targeted nucleic acid, for  
XX example RNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S  
XX or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may  
XX comprise any one of 64 fully defined sequences as given in the  
XX specification. The present sequence is that of a DNA sequence which  
XX represents the sequence of 16S rRNA of *Burkholderia mallei* related to the  
XX invention.

XX Fixing useful genes e.g. phenol hydroxylase to micro organism ecosystems  
PT e.g. phenol decomposition activated sludge, involve isolating dominant  
PT strain in ecosystem, introducing a useful gene and returning the strain  
XX to the ecosystem.  
XX  
XX Example 2; SEQ ID NO 1; 20pp; Japanese.  
XX  
XX The invention relates to a method for fixing a useful gene in  
XX microorganisms ecosystems, comprising isolating a strain from  
XX microorganisms ecosystem, which is a dominant strain within the  
XX ecosystem, introducing a useful gene into the isolated strain and then  
XX returning the strain to the microorganisms ecosystem. The method is  
XX useful for fixing a useful gene e.g., phenyl hydroxylase gene to a strain  
XX dominant within a ecosystem, such as Comamonas sp. IN7 strain and its  
XX closely related strains. It is also useful for increasing phenol  
XX decomposition activity in a sludge, and for purifying environment  
XX contaminated with phenol. The current sequence represents a phenyl  
XX hydroxylase gene fragment.

XX Use of an antibacterial agent in the manufacture of a medicament for  
PT treating osteoarthritis.  
PT  
XX Example 1; Fig 12; 89pp; English.  
PS  
XX The present invention relates to the use of an antibacterial agent in the  
CC production of a treatment for osteoarthritis. The bacteria causing  
CC osteoarthritis is Jantchinobacterium lividum. The present sequence is a  
CC fragment of the 16S RNA coding sequence from J. lividum shown in the  
CC exemplification of the invention

PT Isolated nucleotide sequences of Neisseria meningitidis which can be used  
PT in the diagnosis and treatment of N. meningitidis infection and other  
PT Neisseria infections, for example, N.gonorrhoea.

Claim 7, Page 866-1272; 1760p; English.

CC The present invention describes methods of obtaining immunogenic proteins  
CC from Neisseria genomic sequences. AAA81453 to AAA82414 represent  
CC specifically claimed Neisseria meningitidis genomic DNA sequences;  
CC AAA81260 to AAA81303 and AAB25620 to AAB25663 represent Neisseria DNA  
CC sequences and their corresponding proteins; AAA81254 to AAA81259 and  
CC AAA81304 to AAA81321 represent PCR primers used in the isolation of  
CC Neisseria meningitidis DNA sequences; and AAA81322 to AAA81452 represent  
CC Neisseria meningitidis MenB polynucleotide ORF sequences, which are all  
CC used in the exemplification of the present invention. The nucleic acid  
CC sequences, protein sequences, and antibodies against them, can be used in  
CC the manufacture of a composition. The composition can be used as a  
CC medicament (or in the manufacture of a medicament) for treating,  
CC preventing or diagnosing infection due to Neisseria bacteria. For  
CC example, some of the identified proteins could be components of vaccines  
CC against Meningococcus B; against all serotypes; and/or against all  
CC pathogenic Neisseriae. Identification of sequences from the bacterium  
CC will also facilitate production of biological probes, particularly  
CC organism-specific probes. Attempts to make efficacious Meningococcus B  
CC vaccines have failed mainly due to antigen tolerance. Multivalent  
CC vaccines have also been tried but none have successfully overcome  
CC antigenic variability. The provision of further, complete sequences may  
CC provide an opportunity to identify secreted or surface exposed proteins  
CC that may be presumed targets for the immune system and which are not  
CC antigenically variable or at least more conserved than other more  
CC variable regions

Masignani V, Galeotti C, Mora M, Ratti G, Scarselli M, Scarlato V;

XX

[illegible]

frames are used to detect, treat and prevent Neisserial infections.

PS Claim 7; Appendix A; 692pp; English

AA The present invention describes the full length genome of *Neisseria*  
CC meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613  
CC represent fragments of the NMB genomic sequence, as the sequence was too  
CC long to go in a record on its own it was split into 8 sequences which  
CC overlap each other at the beginning and end of each sequence by 49980 bp

Neisseria meningitidis B full length genome sequence and open reading  
 frames are used to detect, treat and prevent Neisserial infections.

Claim 7; Appendix A; 692pp; English.

The present invention describes the full length genome of Neisseria  
 meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613  
 represent fragments of the NMB genomic sequence, as the sequence was too  
 long to go in a record on its own it was split into 8 sequences which  
 overlap each other at the beginning and end of each sequence by 4980 bp  
 (i.e. the last 4980 bp of AAF21544 is repeated at the beginning of  
 AAF21607, the last 4980 bp of AAF21607 are repeated at the beginning of  
 AAF21608, and so on). AAF21545 to AAF21588 encode the Neisseria proteins  
 given in AAB58550 to AAB58593, and AAF21589 to AAF21606 represent PCR  
 primers which are used in the exemplification of the present invention.  
 The NMB genome and fragments from it have antibacterial activity, and can  
 be used in vaccines and gene therapy. Neisseria nucleic acids, proteins  
 and/or antibodies which binds to the proteins can be used in compositions  
 for treating or preventing infection due to Neisserial bacteria or as a  
 diagnostic reagent for detecting the presence of Neisserial bacteria or  
 of antibodies raised to Neisserial bacteria. Computers, computer memory,  
 computer storage medium or computer databases can be used in a search to  
 identify open reading frames (ORFs) or coding sequences within the NMB  
 genome. The DNA sequences provide further opportunities to find antigenic  
 or immunogenic proteins which are more effective in vaccines than the  
 outer membrane proteins currently used

XX Neisseria meningitidis B full length genome sequence and open reading  
PT frames are used to detect, treat and prevent Neisserial infections.  
XX  
PS Claim 7; Appendix A; 692pp; English.

The present invention describes the full length genome of *Neisseria meningitidis* B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613 represent fragments of the NMB genomic sequence, as the sequence was too long to go in a record on its own it was split into 8 sequences by 49980 bp overlap each other at the beginning and end of each sequence by 49980 bp (i.e. the last 49980 bp of AAF21544 is repeated at the beginning of AAF21607, the last 49980 bp of AAF21607 are repeated at the beginning of AAF21608, and so on). AAF21545 to AAF21588 encode the *Neisseria* proteins given in AAB5550 to AAB58593, and AAF21589 to AAF21606 represent PCR primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. *Neisseria* nucleic acids, proteins and/or antibodies which binds to the proteins can be used in compositions for treating or preventing infection due to *Neisseria* bacteria or as a diagnostic reagent for detecting the presence of *Neisseria* bacteria or of antibodies raised to *Neisseria* bacteria. Computers, computer memory, computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the outer membrane proteins currently used

DR	Depleting or isolating targeted nucleic acids e.g. rRNA, involves using a
PT	bridging oligonucleotide comprising bridging region and a targeting
PT	region complementary to a targeted nucleic acid, and a capture
XX	oligonucleotide.
XX	Claim 4; Page 175; 208pp; English.
XX	This invention relates to a novel method for isolating, depleting or
CC	separating a targeted nucleic acid, such as rRNA, from a sample
CC	comprising targeted and non-targeted nucleic acids. It effects a way of
CC	enriching for non-targeted nucleic acids such as rRNAs. Isolating
CC	sufficient quantities of high quality bacterial mRNA is a demanding
CC	process which impedes analysis of bacterial gene expression in the
CC	presence of host cells. A small percentage of bacterial mRNAs may be poly
CC	-A tailed, but these are targeted for degradation and tend to be
CC	unstable. As a result, the commonly employed method for mRNA purification
CC	with eukaryotic cells, oligo-dT capture, is ineffective. The present
CC	invention provides an alternative, more suitable method for mRNA
CC	purification from prokaryotes. The method of the invention comprises the
CC	incubation of a sample with a bridging oligonucleotide (containing a
CC	targeting region) and subsequently incubating with a capture
CC	oligonucleotide allowing the isolation of the target from the sample. The
CC	method is useful for depleting or isolating targeted nucleic acid, for
CC	example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S
CC	or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may
CC	comprise any one of 64 fully defined sequences as given in the
CC	specification. The present sequence is that of a DNA sequence which
CC	represents the sequence of 16S rRNA of Burkholderia pseudomallei related
CC	to the invention.

PT Antibacterial compound, useful for treating bacterial infections and as

PT oligonucleotides complementary to bacterial 16S and 23S rRNA

PS Disclosure; Page; 62pp; English.

CC AAS11021,AAS11034 represent the coding sequences of bacterial 16S-  
CC ribosomal RNA (rRNA) genes. The sequences were used to design anti-  
CC bacterial compounds comprising substantially unchanged antisense  
CC oligomers containing 8-40 nucleotide subunits, including a targeting  
CC nucleic acid sequence at least 10 nucleotides in length which is  
CC complementary to a bacterial 16S or 23S rRNA nucleic acid sequence. The  
CC antisense oligomers are used for treating a bacterial infection in a  
CC human or a mammalian animal produced by *Escherichia coli*, *Salmonella*  
CC typhimurium, *Pseudomonas aeruginosa*, *Vibrio cholerae*, *Neisseria*  
CC gonorrhoea, *Helicobacter pylori*, *Bartonella henselae*, *Haemophilus*  
CC influenza, *Shigella dysenteriae*, *Staphylococcus aureus*, *Mycobacterium*  
CC tuberculosis, *Streptococcus pneumoniae*, *Treponema pallidum* and *Chlamydia*  
CC trachomatis. The antibacterial compound may be used as a food grain  
CC supplement in livestock and poultry food composition. Note: The present  
CC sequence is not shown in the specification but has been accessed from  
CC Genbank using the appropriate accession number given in the  
CC specification. (Updated on 06-AUG-2003 to correct OS field.)

XX Detection of a trichloroethylene-decomposing microbe - using a medium  
XX containing the chemical.  
XX Claim 1; Page 11; 17pp; Japanese.  
XX  
XX The present sequence represents a 16S rDNA of a trichloroethylene-  
XX decomposing microbe, Burkholderia sp. N16-1 (FERM BP-5504). The invention  
XX relates to a method for the detection of a trichloroethylene-decomposing  
XX microbe, Burkholderia sp. N16-1 (FERM BP-5504) in which it is selectively  
XX detected or counted by a medium containing the chemical by using the  
XX chemical-resistant strain; It also provides a mutant of the  
XX trichloroethylene-decomposing microbe, Burkholderia sp. N16-1 (FERM BP-  
XX 5504) having chemical resistance and maintaining trichloroethylene-  
XX decomposing activity

XX detoxify atrazine, e.g. in soil, at a wide variety of concns.  
XX  
XX Example 2; Col 33-36; 34p; English.  
XX  
XX Novel bacterial strain ADP (ATCC 55464), isolated from atrazine-  
XX contaminated soil, is capable of degrading s-triazine cpds, including  
XX atrazine. In an attempt to identify the strain, the 16S ribosomal RNA  
XX sequence (AAT18760) was compared to that of *Escherichia coli* (AAT18759),  
XX *Pseudomonas citromellolis* ATCC 13674 (AAT18761-63), *Pseudomonas*  
XX *aeruginosa* (AAT18764), *Pseudomonas testosteroni* (AAT18765) and  
XX *Pseudomonas cepacia* (AAT18766). It was concluded that ADP is closely  
XX related to, but distinct from, *P. citromellolis* and *P. aeruginosa*.

XX
XX Terephthalic acid producing proteobacteria isolated by culturing sample
XX suspected of containing the bacteria in medium having aromatic organic
XX substrate, adding xylene and isolating bacteria producing terephthalic
XX acid.
XX
XX Claim 4; Col 19-20; 21pp; English.
XX
XX The invention describes a pure isolate of a terephthalic acid (TA)
XX producing proteobacteria, comprising genes encoding all enzymes of the TA
XX biosynthetic pathway. The proteobacteria are useful for producing TA and
XX isophthalic acid, and various intermediates in the synthesis of TA such
XX as 4-carboxybenzyl alcohol and 4-carboxybenzaldehyde. The TA and
XX isophthalic acid have utility in the production of polyesters needed in
XX fibres, films, paints, adhesives and beverage containers. This sequence
XX represents the Burkholderia sp 16S ribosomal RNA gene amplification of
XX which was used to identify Burkholderia and Pseudomonas isolates

XX New terephthalic acid-producing microorganism e.g. for producing  
XX terephthalic acid for production of polyesters commercially required in  
XX large quantities for fibers, films, paints, adhesives and beverage  
XX containers.  
XX  
XX Claim 6; SEQ ID NO 1; 24p; English.  
XX  
XX The invention relates to a terephthalic acid (TPA) producing  
XX microorganism isolated by a process comprising culturing a sample  
XX suspected of containing a TPA producing microorganism in a suitable  
XX growth medium containing at least one aromatic organic substrate selected  
XX from p-xylene, p-toluic acid and TPA, selecting those microorganisms that  
XX are able to use every substrate selected individually from p-xylene, p-  
XX toluic acid and TPA as a sole carbon source, contacting the  
XX microorganisms selected in the above step with p-xylene to form a  
XX reaction medium and monitoring the reaction medium over time for the  
XX presence of TPA, where the production of TPA indicates the presence of a  
XX TPA producing microorganism. The invention also relates to a method of  
XX producing isophthalic acid (IPA) by contacting an isolated TPA producing  
XX microorganism with an aromatic organic substrate and at least one  
XX suitable induction compound, where isophthalic acid accumulates, and  
XX optionally recovering the isophthalic acid. The microorganism is useful  
XX for producing terephthalic acid for the production of polyesters that are  
XX commercially required in large quantities for fibres, films, paints,  
XX adhesives and beverage containers. The isophthalic acid is useful in

CC condensation reactions with diamines to form polyamides. This sequence  
CC represents the 16s rRNA gene of the TPA producing microorganism  
CC Burkholderia isolate IR3.

PT New bacteria that oxidize arsenic(III), useful for treating drinking  
water or effluents, can use arsenic(III) as sole energy source.

PS Claim 1; Page 27; 28pp; French.

CC The present invention relates to isolated, autotrophic, aerobic bacteria  
that can oxidize arsenic (III) to arsenic (V) using carbon dioxide as its  
sole source of carbon and as (III) as sole source of energy. They have  
16S sequences (ABL53376 and ABL53377). The bacteria are useful for  
treating water intended for human consumption, or mining and industrial  
waste, and for converting arsenic (III) to arsenic (V) which is easier to

CC remove, less toxic and less mobile

XX      CC      The invention relates to an isolated 16S rDNA sequence. The 16S rDNA
CC      sequences and methods are useful in rapidly identifying and monitoring
CC      the corresponding bacterial strains in samples taken from a wastewater
CC      bioreactor or from any environment which might contain the specified
CC      bacteria. The present sequence represents the 16S rDNA from an unknown
CC      organism.

 PT bacterial strains in samples taken from a wastewater bioreactor.  
 PS  
 XX Claim 1; SEQ ID NO 4; 25bp; English.  
 CC  
 CC The invention relates to an isolated 16S rDNA sequence. The isolated 16S  
 CC rDNA sequence is indicative of the presence of an activated sludge  
 CC bacterial strain. The invention also relates to methods for identifying  
 CC an activated sludge bacterial strain, a pyruvate degrading bacterial  
 CC strain, an acetate degrading bacterial strain, a benzoate degrading  
 CC bacterial strain, methods for degrading pyruvate, acetate or benzoate and  
 CC a method for reducing nitrate. Identifying an activated sludge bacterial  
 CC strain comprises extracting genomic DNA from a bacterial cell and probing  
 CC the extracted genomic DNA with a probe derived from any of the above-  
 CC mentioned sequences under suitable hybridisation conditions, where the  
 CC identification of a hybridisable nucleic acid fragment confirms the  
 CC presence of an activated sludge bacterial strain. Alternatively, the  
 CC method comprises extracting genomic DNA from a bacterial cell and  
 CC amplifying the extracted genomic DNA with at least one oligonucleotide  
 CC primer corresponding to a portion of the above-mentioned sequences, such

CC that amplification products are generated, where the presence of  
CC amplification products confirms the presence of an activated sludge  
CC bacterial strain. The bacterial cell is contained within wastewater  
CC sludge or within an environmental sample selected from groundwater and  
CC soil. Degrading pyruvate, acetate or benzoate comprises contacting the  
CC bacterial strain under suitable growth conditions with an amount of  
CC pyruvate, acetate or benzoate. Reducing nitrate comprises contacting the  
CC bacterial strain under suitable growth conditions with an amount of  
CC nitrate. The 16S rDNA sequences and methods are useful in rapidly  
CC identifying and monitoring the corresponding bacterial strains in samples  
CC taken from a wastewater bioreactor or from any environment which might  
CC contain the specified bacteria. This sequence represents an isolated 16S  
CC rDNA of the invention.

 PT New biologically pure culture of a strain of *Chromobacterium suttsuga* sp.  
 PT nov. possessing insecticidal activity, useful for biocontrol of insect  
 PT pests.  
 PS Claim 3; SEQ ID NO 1; 19pp; English.  
 XX  
 CC The present invention relates to a biologically pure culture of a strain  
 CC of *Chromobacterium suttsuga* sp. nov. The invention also relates to  
 CC insecticidally active metabolites obtained from the strain of  
 CC *Chromobacterium suttsuga* sp. nov. The invention is useful for biocontrol  
 CC of insect pests. The present sequence is the *Chromobacterium suttsuga*  
 CC NRRL B-30655 16S ribosomal DNA (rDNA).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/organism="Chlamydomonas reinhardtii"

/mol\_type="rRNA"

/db\_xref="taxon:3055"

/clone\_1ib="C. reinhardtii CC-1690 (mt+), Stress III

(normalized), Lambda Zap II"

/note="Vector: pBluescript II SK-; Site 1: EcoRI; Site 2:

XhoI; Stress condition III library, constructed by

Jeanette Quinn and Ching-Wen Chang, combines cDNAs from

CC-1690 cells grown to mid-log phase in copper-free TAP

medium (see Quinn and Merchant (1998) Methods in

Enzymology, 2997:263-279) in a shaking (250 rpm) illuminated

(about 100 micromole/m2/sec) incubator at 22 C (see Quinn

and Merchant (1998) Methods in Enzymology, 2997:263-279);

CC-1690 cells grown to mid-log phase in low Fe (1

micromolar Fe) TAP medium (see La Fontaine S, Quinn JM,

Nakamoto SS, Page MD, Gohre V, Moseley JL, Kropat J,

Merchant S, LaFontaine et al. (2002) Eukaryotic Cell,

1:736-757) in a shaking illuminated incubator (same

conditions as above). CC-1690 cells were grown to mid-log

phase in TAP medium in a shaking illuminated incubator to

a density of 8x10<sup>6</sup> cells/ml. The flask was transferred to

a shaking platform (200 rpm) at room temperature (23C) 12

micromole/m2/sec illumination and bubbled in a stoppered

flask with 98% nitrogen, 2% CO<sub>2</sub> gas mixture for 1 hour

prior to harvesting for RNA isolation (as per Quinn JM,

Barriaco P, Eriksson M, Merchant S, Quinn et al. (2000) JBC

275:6080-6089); CC-1690 cells grown to mid-log phase

(3x10<sup>6</sup> cells/ml) in TAP medium in a shaking (150 rpm)

illuminated (70 mole photon/m2/sec) incubator at 27 C.

Cells were diluted to 1x10<sup>6</sup> cells/ml, transferred to high

light (11000 mol photon/m2/s) with shaking (150 rpm) and

sampled at (0.5, 1.2, 4.6, 12 hrs). PolyA mRNA was purified

from each sample, pooled and cDNA synthesized (see Shragar

et al, Plant Physiol. 131, 401-408 for details). The cDNA

was directionally cloned into lambda Zap II (Stratagene)

in the EcoRI (5') and XhoI (3') sites. pBluescript II SK-

plasmids were excised from the lambda Zap clones by

superinfection with ExAssist (Stratagene) phage. The

library was normalized using method 4 described in Bonaldi

et al., (1996) Genome Research 6: 791-806."

(normalized), Lambda Zap II"  
/note="Vector: pBluescript II SK-; Site 1: EcoRI; Site 2:  
XhoI; Stress condition III library, constructed by  
Jeanette Quinn and Chung-Men Chang, combines cDNAs from  
CC-1690 cells grown to mid-log phase in copper-free YAP  
medium (see Quinn and Merchant (1998) Methods in  
Enzymology, 2997:263-279) in a shaking (250 rpm) illuminated  
(about 100 micromole/m2/sec) incubator at 22 C (see Quinn

and Merchant (1998) Methods in Enzymology, 2997:263-279);  
CC-1690 cells grown to mid-log phase in low Fe (1  
micromolar Fe) YAP medium (see La Fontaine S, Quinn JM,  
Nakamoto S, Page MD, Gohre V, Moseley JJ, Kropac J,  
Merchant S, LaFontaine et al. (2002) Eukaryotic Cell,  
1:736-757) in a shaking illuminated incubator (same  
conditions as above). CC-1690 cells were grown to mid-log  
phase in YAP medium in a shaking illuminated incubator to  
a density of 8x10<sup>6</sup> cells/ml. The flask was transferred to  
a shaking platform (200 rpm) at room temperature (23C) 12  
micromole/m2/sec illumination and bubbled in a stoppered  
flask with 98% nitrogen, 2% CO<sub>2</sub> gas mixture for 1 hour  
prior to harvesting for RNA isolation (see per Quinn JM,  
Barraco P, Eriksson M, Merchant S, Quinn et al. (2000) JBC  
275:6080-6089); CC-1690 cells grown to mid-log phase  
(3x10<sup>6</sup> cells/ml) in YAP medium in a shaking (150 rpm)  
illuminated (70 mole photon/m2/sec) incubator at 27 C.  
Cells were diluted to 1x10<sup>6</sup> cells/ml, transferred to high  
light (11000 mol photon/m2/s) with shaking (150 rpm) and  
sampled at (0.5, 1.2, 4.6, 12 hrs). PolyA mRNA was purified  
from each sample, pooled and cDNA synthesized (see Shrager  
et al., Plant Physiol. 131, 401-408 for details). The cDNA  
was directionally cloned into Lambda Zap II (Stratagene)  
in the EcoRI (5') and XhoI (3') sites. pBluescript II SK-  
plasmids were excised from the lambda Zap clones by  
superinfection with ExAssist (Stratagene) phage. The  
library was normalized using method 4 described in Bonaldo  
et al., (1996) Genome Research 6: 791-806."

US-09-793-920A-1
; Sequence 1, Application US/09793920A
; Patent No. 6479621
; GENERAL INFORMATION:
; APPLICANT: Canon Inc.
; TITLE OF INVENTION: Polyhydroxyalkanoate containing 3-hydroxyphenylalkanoic acid as
; FILE REFERENCE: monomer unit, and method for producing the same.
; CURRENT APPLICATION NUMBER: US/09/793,920A
; PRIOR FILING DATE: 2001-02-28
; NUMBER OF SEQ ID NOS: 1
; SEQ ID NO 1
; LENGTH: 1501
; TYPE: DNA
; ORGANISM: Pseudomonas jessenii 161 strain.
```

US-10-158-865-1/c
; Sequence 1, Application US/10158865
; Patent No. 6846651
; GENERAL INFORMATION:
; APPLICANT: Fleischmann et al.
; TITLE OF INVENTION: Nucleotide Sequence of the Haemophilus Influenzae Rd Genome, Frag
; Patent No. 6846651
; TITLE OF INVENTION: Thereof, and Uses Thereof
; FILE REFERENCE: PB186P2CID1
; CURRENT APPLICATION NUMBER: US/10/158,865
; CURRENT FILING DATE: 2002-06-03
; PRIOR APPLICATION NUMBER: US 09/557,884
; PRIOR FILING DATE: 2000-04-25
; PRIOR APPLICATION NUMBER: US 08/476,102
; PRIOR FILING DATE: 1995-06-07
; PRIOR APPLICATION NUMBER: US 08/426,787
; PRIOR FILING DATE: 1995-04-21
; NUMBER OF SEQ ID NOS: 1
; SOFTWARE: PatentIn version 3.1
; SEQ ID NO 1
; LENGTH: 1830121
; TYPE: DNA
; ORGANISM: Haemophilus influenzae
; FEATURE:
; NAME/KEY: misc_feature
; LOCATION: (4747)..(4747)
; OTHER INFORMATION: n equals a,t,c, or g
; FEATURE:
; NAME/KEY: misc_feature
; LOCATION: (9921)..(9921)
; OTHER INFORMATION: n equals a,t,c, or g
; FEATURE:
; NAME/KEY: misc_feature
; LOCATION: (10150)..(10150)
; OTHER INFORMATION: n equals a,t,c, or g
; FEATURE:
; NAME/KEY: misc_feature
; LOCATION: (29298)..(29298)
; OTHER INFORMATION: n equals a,t,c, or g
; FEATURE:
; NAME/KEY: misc_feature
; LOCATION: (36543)..(36543)
; OTHER INFORMATION: n equals a,t,c, or g
; FEATURE:
; NAME/KEY: misc_feature
; LOCATION: (36636)..(36636)
; OTHER INFORMATION: n equals a,t,c, or g
; FEATURE:
; NAME/KEY: misc_feature
; LOCATION: (40808)..(40810)
; OTHER INFORMATION: n equals a,t,c, or g

```

Pred. No. is the number of results predicted by chance a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
